1 Theory

We can have inline equations like $E = mc^2$ or display equations like:

$$C\varphi \tag{1}$$

$$i\frac{\psi}{t} = -\frac{\hbar^2}{2m}\nabla^2\psi + V\psi \tag{2}$$

We can link to equations using their labels, like equation (2) or with more emphasis: (2). See the [documentation](#) for more options with using formulas. You might be interested in [specific ways of numbering](#).

Tip

Check the hover-over functionality for these links!

2 Methods

In this project, a starterkit provides you a set of tools, templates and workflows to have a head start on your project. We follow the logic below (not in pdf):

The starterkit is copied to your own repository. With every commit to your repository, the website and pdf are updated. You may want to do some final tweaks to the final version of your pdf.

3 Conclusion

In this study we investigated whether and how scientific publishing is feasible through the use of Jupyter Book. Using a starterkit template repository which can be easily accessed and used, a head start is provided. The [manual](#) provides detailed information to make more technical elements accessible. Hence, we conclude that Jupyter Book provides a feasible way of publishing scientific content - at least for bachelor and master thesis.

4 Appendix

4.1 Cheatsheet

4.2 README

This is the TU Delft starterkit for open publishing with Jupyter Book. It provides a skeleton with basic settings to have a head start with your thesis / project.

It includes:

- a github deploy file taking care of deploying the website and building a pdf
- basic content files that can be altered to fit your project
- yml files in the root folder to configure the book and the pdf build

4.2.1 Where to start

Already know about Jupyter Book, familiar with GitHub or GitLab, Markdown... start with cloning the [starterkit](#) and start writing working on your project. New to the ecosystem? Start with [the manual](#), and then move on to the starterkit.

4.2.2 Purpose

The purpose of this project and this manual is to enable others to use Jupyter Book for writing and publishing their own scientific and educational content. We hope to lower the technical barrier for researchers and educators to create and share their own resources, and to promote open science and open education practices.

4.2.3 License

This book is licensed under the [Creative Commons Attribution-NonCommercial 4.0 International License](#), unless stated otherwise.

You are free to:

- Share — copy and redistribute the material in any medium or format
- Adapt — remix, transform, and build upon the material for any non-commercial purpose provided proper attribution is given.

4.2.4 Errors

If you find any errors in the content, please report them by opening an issue on the [GitHub repository](#).

4.2.5 Funding

This project has received funding from the [Delft University of Technology Open Science Fund \(2025-2026\)](#).

4.2.6 Identifier

TUDJBOSSTARTERKIT
